Canvas P5 — Theme Split & Responsive Batches: Visual Verification Report

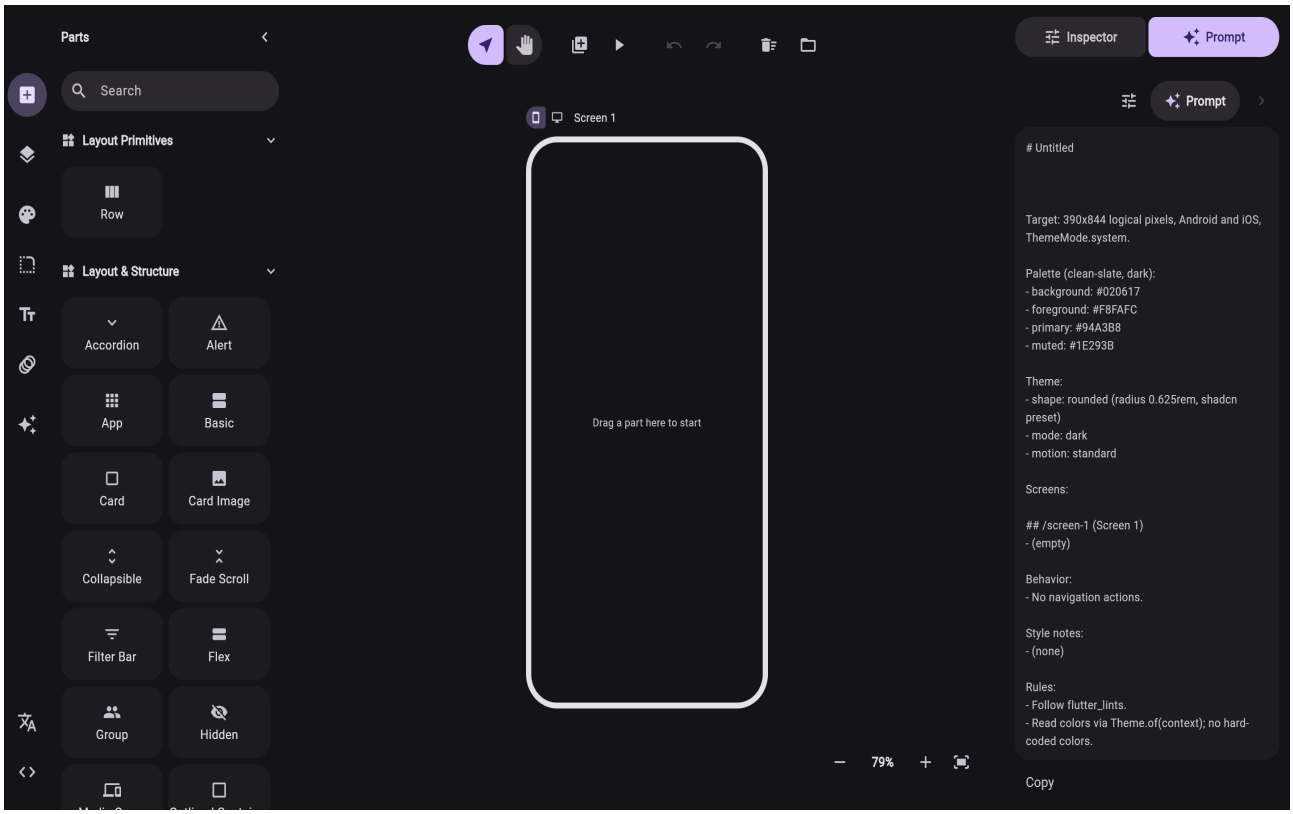

Branch feat/canvas-p3 · Flutter 3.47.2 · 2026-09-05 · Release bundle over static server, 1440×900 viewport

Batch	What landed	Tests
A — clear-path	CanvasStore.clearItemProps (sparse delete); inspector reset uses clear-path	app 225 (was 224)
B — core responsive	CanvasNode.hiddenOn / breakpointValues / slots; resolvers in responsive.dart	core 51 (was 43)
E — inspector UI	setNodeResponsive + Visibility toggles per node	app 232
F — chrome field	CanvasTheme.chrome (nullable, editor-only, export-excluded)	core 59
G — theme split	42 presets selectable; Components vs App-chrome controls; nested ThemedCanvas	app 240
D — render+codegen	Tier filtering (hidden row hides subtree); codegen conditionals; prompt docs	app 244 / core 63

flutter analyze: clean in BOTH packages. Full suite: app 244 pass, core 63 pass, 0 fail.

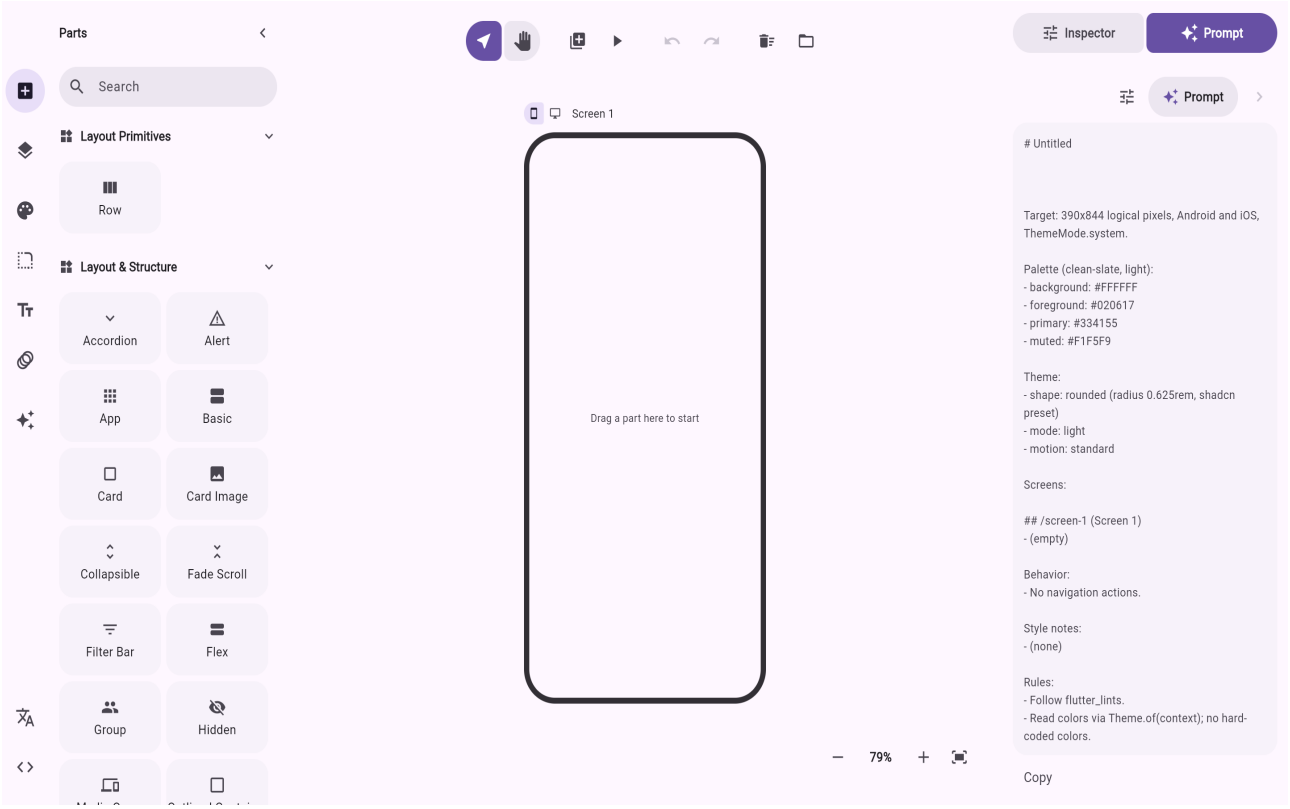

1 · Dark chrome + dark components (default doc)

Default doc (clean-slate, dark, chrome follows components). Chrome consistent: rail, tiles, toolbar, prompt panel all on EditorColors.dark + kit dark scheme. No blue/green stray cards — palette tiles uniform, phone bezel light as spec. Zoom reads 79% (spec default).

2 · Light chrome (ocean-breeze) + light components (clean-slate)

Seeded doc with theme.dark=false and theme.chrome=ocean-breeze/light. Editor shell renders EditorColors.light (surface #FEF7FF); prompt panel reports components palette (clean-slate, light) — proving the split: chrome and components resolve independently. No stray colors in either brightness. Phone bezel follows light token (#322F35).

Findings

F1 — No stray blue/green in app code. Grep over lib/ui + lib/canvas finds hardcoded colors only in editor_tokens.dart (measured M3 spec) and kit doc-comments inside generated embedded_sources.dart (never rendered). Screens confirm: tiles, cards, bezel all on-token in both brightnesses.
F2 — Persistence seed format. shared_preferences_web stores values json-encoded (json.encode of the string). A raw JSON seed is skipped by _decodeValue/getString and the app keeps the default doc — no app bug; seeding must double-encode. Verified: correctly-encoded seed with chrome loaded and rendered.
F3 — Kit Theme is InheritedTheme. Theme.of reads the closest ancestor, so nested chrome/component ThemedCanvas compose safely; the InstalledThemePreset.current global is only read at ThemeData build time.
Not yet visually covered: populated screens with many components, preview-player device presets, inspector Visibility toggles interaction (canvas a11y tree unavailable headless — clicks not scriptable; covered by widget tests instead). Next loop: full-palette demo screen + per-preset screenshots.

Remaining / next loop

1. Full-palette demo screen (all 134 kinds on canvas) + per-tier visibility demo.
2. Screenshot matrix: light/dark × several presets; component-level consistency pass.
3. UI/UX polish pass on inspector + palette (density, empty states).
4. codegen_bundle responsive emission (currently single-file only).
5. Loop: find → fix → re-verify until clean.
