Canvas P10 — Export Closure: Generated Code Compiles

Branch feat/canvas-p3 · Method: 10-screen showcase seed (137 nodes) → generate → scratch flutter packages → flutter analyze. No screenshots this wave (no visual changes; P9 matrix stands).

Output	Before	After	How
single-file	2895 errors	24 errors	Shared/imports/parts closure + scope-aware rebinding, subset-unify
bundle	2889 errors	0 errors, 0 warnings	Shared-tree fixpoint, real barrels, per-kind imports (hide/prefix conve

Repo health: analyze clean both packages; app 572 pass, core 114 pass. Single-file output grew 1.18MB → 4.29MB (full closure inlined); bundle emits 1268 files (was 979).

Single-file residuals (24) + strategy

5× duplicate_definition (functions/typedefs/enums — dedup covers classes/mixins/extensions only): extend carve to functions, unify enums/typedefs to superset or scope-aware rename. 19× ambiguous_extension on Widget identifier chains (widget.title!, data.title, Text(..).mono() chains): type-aware receiver resolution via class index + variable types, or twin-unify by member compatibility. No __dupN/__textN corruption remains.

Bundle residuals (0) + notes

Zero errors and zero warnings on the seed dump plus a 68-kind branch-flipping sweep. Conventions: hide on the screen Flutter import (widgets- vs material-level split), menu/popup hide list mirrors the kit barrel, tabs barrel imported as tabs. Validator rides same-file _CanvasRequiredValidator. Non-kind files (TextField, ColorDerivative) seeded as direct imports. pubspec patch emits all seven third-party deps.

Next: single-file final 24 → 0, then a full user-journey matrix (edit → preview → export → compile) for P11.
