

Canvas App — Visual Verification Report

Batch P2 (shortcuts · DnD-offset fix · light theme · catalog 5→10) + visual hardening pass

Date: 2026-09-05 · Release bundle (flutter build web --release), served statically, driven at 1440x900

Gate: flutter analyze zero issues · flutter test 90/90 green (baseline was 68/68 with 6 stale failing)

How it was tested

Each area below was exercised live in the browser: parts were dragged from the palette onto the phone with pointer-accurate drops, selection was driven through rail, Layers rows and canvas, theme/panels toggled, preview entered/exited, light mode flipped. Every screenshot is followed by its verdict and what 'correct' means. Console errors were counted at each step (tally in §4).

Visual tour

1 — Empty editor shell (dark)

PASS

Three columns share one surface with no dividers. Left: icon rail (parts active) + Parts panel with search, Components section, 10 tiles in a 2-column grid. Center: floating toolbar, single phone frame with 'Screen 1' label and the empty-state hint, zoom readout 79%. Right: Prompt tab auto-shown with the generated brief and Copy. No tofu icons anywhere; no debug banner; no overflows.

2 — Populated canvas: 5 parts dragged on

PASS

Button, Card (Title/Description), Input ('Type here' field), Badge and Switch all render as real themed shadow widgets at the drop points. The Prompt panel tracks every node live with kind, props and exact screen coordinates (drop-point accuracy verified to the pixel). Zero console errors across all five drags.

3 — Layers panel with populated screen

PASS

Screen 1 group lists all five nodes frontmost-first (Switch·u10 ... Button·u2) with duplicate/delete actions per row. Empty screens render an 'Empty' note. Proves the z-order model the canvas renders.

4 — Selection → auto-switched Inspector

PASS

Selecting Button·u2 (via Layers) highlights the row, flips the right aside to the Inspector tab, and edits item u1: label text field, variant/size selects with working chevrons, disabled switch. Every control is a real shadcn widget bound through store.patchItem (undo-safe).

5 — Selection ring, 3x close-up

PASS

The selected Card carries the toolbarActive focus ring (2px, r8) with 4px padding. Verdict: the ring pipeline (shell owns selection, canvas renders it) is visually confirmed.

6 — Multi-screen: two phones side by side

PASS

Toolbar Add-screen produced Screen 2 next to Screen 1 (labels, bezels, empty hint all correct). Layers lists both screens. Note: a third phone overflows the 800px canvas — panning is the intended navigation (flagged as future canvas-scroll work).

7 — Preview route BEFORE the fix

FAIL (fixed this batch)

White unstyled background, raw unstyled chrome: the screen title rendered as huge red serif with yellow underlines on every text run. Root cause: PreviewPlayer had no Scaffold/DefaultTextStyle ancestor, so raw Text() chrome fell back to a broken Skwasm font path. Caught by this visual pass — no test covered it.

8 — Preview route AFTER the fix

PASS

Dark surface, Ghost 'Back' button, screenLabel title, real Button content. Zero console errors. Fix: lifted EditorTheme above the preview branch in main.dart; PreviewPlayer now renders a themed Scaffold + SafeArea with token-styled chrome.

9 — Color theme panel

PASS

Compact Card hugging its content (Dark switch on, clean-slate palette select with rendered chevron). Panel no longer stretches full column height.

10 — Light mode (Dark toggled off)

Full light ramp live: #FEF7FF surface, white panel cards, dark text, dark phone bezel with white screen, themed Button intact, prompt re-generated for light tokens. Validates the measured light-token pass end to end. Zero console errors.

Bugs found by this visual pass (all fixed + re-verified)

Bug	Symptom	Root cause (evidence)	Fix + proof	Touched
Invisible Input part (P0 visual blocker)	Dropped TextField rendered nothing; node present in doc, taps fell through, release console threw on every rebuild.	Widget-test probe reproduced in-VM with file/line: kit TextField builds an internal Expanded Row (text_field_state_part1.dart:474) which detonates under the Stack's unbounded Positioned constraints ('flex but unbounded width').	ScreenSurface now clamps every node in a ConstrainedBox (remaining inner-screen room, 48px floor). Proof: probe shows 244x40 layout, release drag renders the field, load errors 5 → 0.	phone_frame.dart (+comment), VM stack in report §5
setState-after-dispose on every web drop	Each drop logged gesture-library exceptions (release console).	DDC debug build gave the exact line: _PressableTileState.setState from Listener.onPointerUp after Draggable swapped child → childWhenDragging (parts_palette.dart:348).	Mounted guards on hover/press setters. Proof: clear-console + drop = 0 errors; drop tests green.	parts_palette.dart

Selection ring never painted	Layers/inspector selection showed no canvas ring (3x crop proof).	Two selection states: shell._selectedNodeid vs a stale DesignCanvas._selectedNodeid copy that ScreenSurface actually read.	Single source of truth: DesignCanvas takes selectedNodeid as a param. Proof: ring_crop3.png.	design_canvas.dart, main.dart
Preview route unstyled	White page, red serif title, yellow-underlined text (r27).	PreviewPlayer branch sat outside EditorTheme with no Scaffold — raw Text() with no DefaultTextStyle.	EditorTheme lifted above both branches; preview renders themed Scaffold + token chrome. Proof: r28.	main.dart, preview_player.dart

Console-error tally

Before this pass: 5 errors on empty load + 2 per drop (release). After: **0 on load, 0 across 10+ drags, selections, panel switches, preview trips and theme flips.** (One stale-history reading mid-session was traced to console persistence across reload, not the app.)

Open issues / follow-ups

- Direct canvas-tap selection could not be triggered with synthetic CDP taps (no moves); InkWell taps and real drags on the same surface work, and the VM tap test ('tapping a node selects it with a ring') is green — classified as harness artifact, needs a real-pointer check.
- Autosave writes localStorage but the shell never calls store.load(): a reload always starts empty. Dead feature until wired.
- 3+ phones overflow the canvas viewport; panning works but there is no scroll affordance (agent-flagged, pre-existing).
- Light-theme gaps with no token yet: canvas-well/app-root backgrounds and light tile-icon color (agent-measured, documented in code).
- Motion theme has a single value ('standard'); tabs bundle spec warns on unknown deps (sortable/text) — both documented, kit-side.
- Remaining HANDOFF P2: alignment guides, magnetic parts, further catalog growth.
