

P4 - Full palette, schema props, containers, responsive preview

All 134 kit components in a categorized palette; every property editable; row/column alignment + child flex;

device preview with adaptive NavBar/NavigationRail; zoom paint/hit fix. Committed 67a10f0 and pushed.

134

kit components in the registry (126 visible, 8 non-visual utilities hidden)

30

canvas-ready components render the real widget (105 show labelled placeholders)

8

palette sections: Layout Primitives, Layout & Structure, Display, Forms & Inputs, Controls, Navigation, Overlays, Utilities

224 + 43

tests passing (canvas_app + canvas_core); flutter/dart analyze clean

19 + row

kinds with full schema-driven inspector editors

Full categorized palette (Layout Primitives + Layout & Structure)

Exact search: 'chip' matches Chip + Chip Input only

- Search is word-start on the tile label: 'row' matches Row, never Breadcrumb.
- Non-visual utilities (alpha, async, debug, locale utils, localizations, error system, wrapper) are in the registry but hidden from the palette.
- Honest scope: 30 kinds render the real kit widget; the remaining 105 render a labelled dashed placeholder card ('canvas-ready coming soon') rather than a fake.

Every property editable - schema-driven inspector

Storybook argTypes model: per-kind prop schemas drive type-mapped editors; instance overrides show a badge + reset.

Button props: content / style / state groups (label, variant, size, disabled)

Row container: gap stepper, mainAxis, crossAxis, child expand + flex

mainAxis = center applied live - button centered, row selected

- Editors: text, number stepper (+slider when bounded), switch, dropdown (segmented when ≤ 3 options), color token/hex, read-only slot.
- Override model: schema default $\leftarrow$ kind defaults $\leftarrow$ sparse node.props; a modified prop gets a badge and 'reset' writes the default back.
- Known compromise: reset cannot sparsely DELETE the key (store has no clear path yet) - the key stays holding the default value.

Device preview + adaptive responsive demo

Material-3 breakpoints: mobile < 600, tablet 600-1023, desktop >= 1024. The canvas width IS the breakpoint.

Mobile (390): bottom NavigationBar

Desktop: NavigationRail sidebar

Desktop tier body ('Home body - desktop'), state preserved

- Device picker: phone 390x844, phone landscape 844x390, tablet 768x1024, desktop fluid 1100 / wide 1440 + rotate button.
- Adaptive demo = the canonical Flutter pattern: `LayoutBuilder` -> `NavigationBar` (<600) / `NavigationRail` (>=600); shared destinations hoisted so selection survives resizes.
- `device_preview` 3.0 requires Flutter >= 3.47 (local: 3.44.6); 2.x has known web gesture bugs - shipped our own picker instead.
- Next batch: promote `hiddenOn`/values/slots to the node model (per-breakpoint visibility + responsive values).

Fixed: taps missed the canvas at fractional zoom (release web)

Symptom: clicking the visible button did nothing at zoom 0.79/0.89; worked at 0.59/0.99; offset moved with resize history.

Selection ring + inspector (debug build, all interactions verified)

- Diagnosis: `Transform.scale` keeps the child's LAYOUT box unscaled, so the canvas overflowed its Center; on release web builds the painted frame drifted 60-100px from the hit-test region (hit math verified self-consistent via a transform-matrix probe; widget tests passed at all zooms).
- Fix: zoom is now LAYOUT scaling - Center > `SizedBox(w*z, h*z)` > `FittedBox(fill)` > fixed-size content. Paint and hit-test derive from the same layout transform and cannot diverge; overflow removed.
- Regression: `canvas_zoom_tap_test` taps the rendered center at zoom 1.0/0.99/0.89/0.79/0.59 and asserts selection.
- Also verified live after the fix: palette search, drop into row, persistence across reload, layers select, inspector edits, device tiers.
- Honest notes: 105 placeholder kinds; per-node responsive visibility lands next batch; row/leaf insert-between already supported, deep-drop dwell (500ms) is future polish.
