Canvas P6 — Functional Loop (H/I/J/K/L): Verification Report

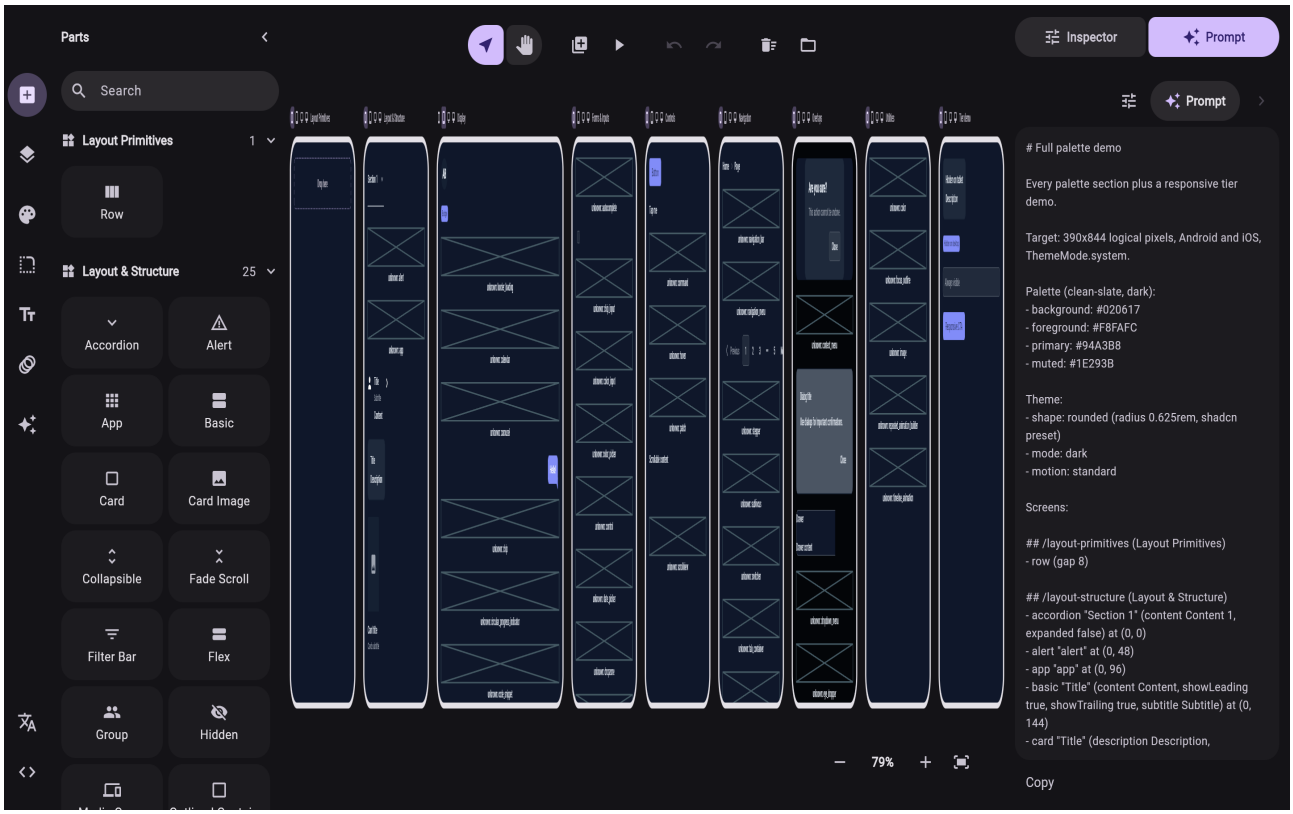

Branch feat/canvas-p3 · Flutter 3.47.2 · Release bundle, static server, 1440×900 · Full-palette seed: 9 screens, 131 nodes, 2 tap actions

Track	What landed	Tests
H — interaction	Screen select/delete (dangling guard + SnackBar); scoped toolbar delete; new-screen device mode; wheel/pinch/m	22 new
I — inspector	11 new PropSpecs; rhythm/headers/empty-states; palette polish	7 new
J — builders	17 real builders incl. basic, card_image, default scaffold; kind specs	40 new
L — theme probe	Repro tests prove split works as designed; dogfood audit table	7 new
K — actions	On-tap editor card; bundle nav+responsive emission; screen bg follows theme	12 new
Seed tool	tool/seed_full_palette.dart, self-validating (refs+round-trip+coverage)	—

flutter analyze: clean in BOTH packages. Full suite: app 346 pass, core 68 pass, 0 fail. Zero console errors with 131 nodes rendered.

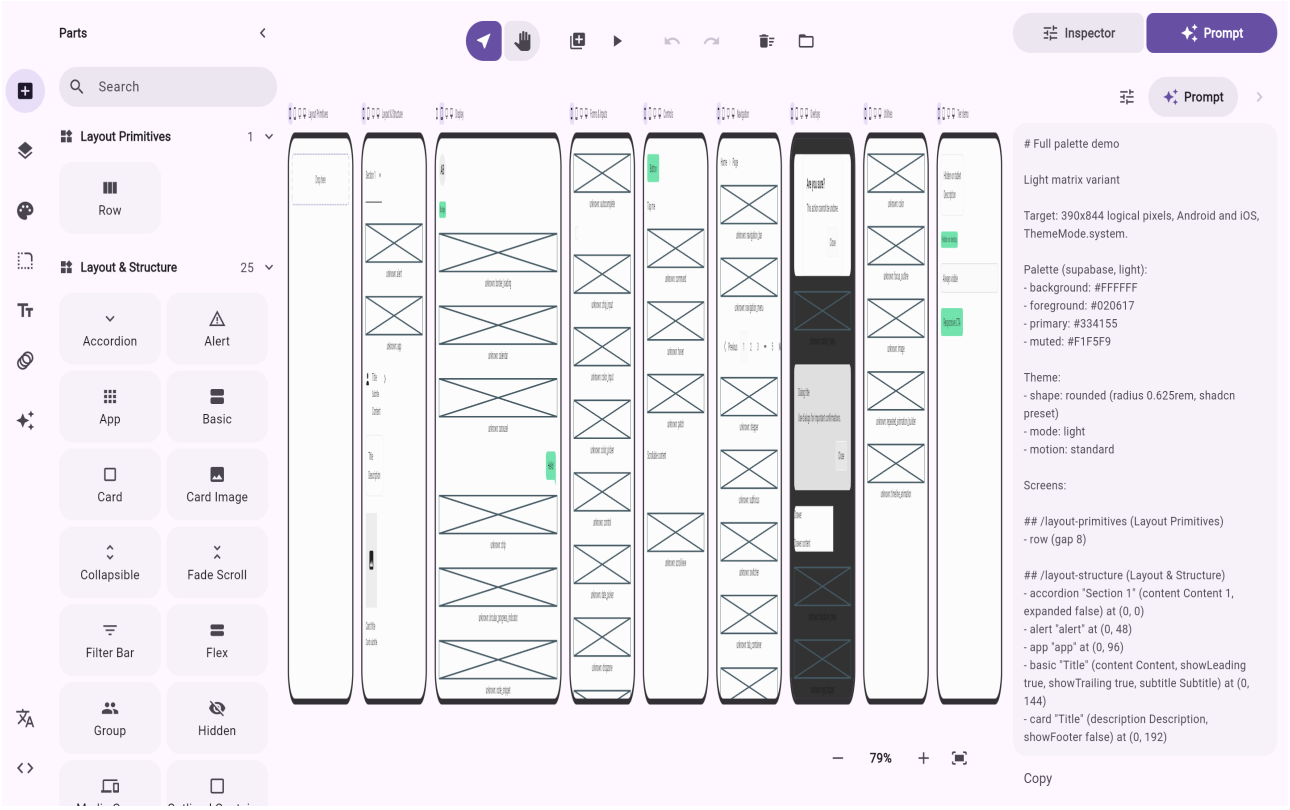

1 · Matrix A — dark / clean-slate, full palette

9 screens render side by side; prompt panel enumerates every node (export contract holds). Real builders verified live: basic (Title/Subtitle/Content), Card title/subtitle, alert dialog, drawer, pagination. Tier-demo screen present. Remaining `unknown:` + X-box slots are kinds with no CatalogEntry yet — the measured backlog below, not crashes.

2 · Matrix B — light / supabase, full palette

Same seed under supabase/light: prompt reports (supabase, light); chrome + components both light and consistent; no stray colors. Tier demo at phone width shows "Hidden on tablet" visible and mobile-hidden node filtered — tier filtering live in the editor.

Findings → backlog for the next loop

B1 — Unknown-kind backlog (~88 kinds). Palette sections list 134 kinds; 36 have builders. Groups: overlay-driven (menu, popover, popup, menubar, dropdown_menu, context_menu, hover_card, command, swiper, refresh_trigger), controller/engine-driven (slider, calendar, date/time pickers, carousel, table, tree, form/*, color_picker/*, input_otp, stepper, tab_*), non-visual utilities (async, formatter, control), WIP (feature_carousel). Each needs its own wiring batch with live-context handling.
B2 — regen caveat. tool/gen_registry.dart _bridgeKinds must learn the 17 bridged kinds or a regen reverts them to placeholders.
B3 — Dogfood replacements (from audit). kit Tooltip/TextField/Dialog/buttons for editor_buttons, icon_rail, right_aside, parts_palette, layers_panel, open_dialog, phone_frame, prompt_panel (Scaffold/AppBar/NavigationBar stay; drag-feedback Material stays).
B4 — Builder↔spec wiring. Track I specs are spec-only until builders read them (avatar size, divider thickness, etc.); wire per kind.
Fixed this loop: delete-clears-all → scoped delete; dead device icons → per-screen device mode; no mouse zoom → wheel/pinch/middle-drag; unknown basic/card_image → real builders; stray Description → confirmed card description default (regression-pinned); dark toggle confusion → proven by-design + explanation; dead screen.bg → follows components theme; no tap assignment → On-tap editor + preview nav + bundle emission.

Loop rule: find → fix → analyze+test → screenshot → next. Run `dart run tool/seed_full_palette.dart` + this matrix after every builder batch.
